Final project proposal

For my final website project, I want to make a simple site for a Latin radio station. This idea is personal because my stepdad has his own radio station called *El Metro Salsero*. He plays salsa music, talks about Latin culture, and loves supporting new and upcoming artists. He always asks me to help him with tech stuff, like creating posters for him on Canva or downloading files. So I thought it would be cool to make a website for him. I want to try using what we've done in class to build something simple that he can actually use.

The website will have 3 pages: Home, About the Radio Station, and Song Recommendations. The Home page will welcome visitors with the station name and a short message about what kind of music it plays. The About page will explain how the radio station started, what my stepdad's mission is, and how he's sharing Latin culture and music. The Song Recommendations page will list a few songs people should check out, with artist names and maybe links to listen.

For design, I'll use two Google Fonts: something bold for headings and something easy to read for body text. I was thinking about these 2 fonts. I looked them up on google Pacifico and Open Sans . My three main colors will be red, gold, and black, because they give off energy and match the salsa theme. I'll keep the layout simple and easy to understand.

For animation, I'll use a small CSS effect like making buttons or text change when you hover over them. I also want to try a basic p5.js sketch on the Home page with shapes moving or floating, just to make the page feel alive. For interactivity, I'll add JavaScript to check that a form is filled out correctly if I include one, and maybe a jQuery effect like expanding more info when someone clicks on a song.

I'll use basic HTML structure on each page like <header>, <nav>, <section>, and <footer>. I'll link one CSS file for styling, and I'll make sure to include my full name and any sources in the footer.
